What are the Shared Spool mods, and what can they do for you?

The shared spool mods enhance the job selection routines that JES2 uses when selecting the next job for execution from the input queue by adding new requirements and qualifications to submitted jobs. Throughout this document, whenever we refer to job selection, we mean the process of selecting a job from the input queue for assignment to an initiator and its immediate execution.

The new requirements that can be used to qualify when a job is eligible to be selected to run, or on which system it can run if you are in a MAS (Multi-Access Spool configuration), are expanded by the shared spool mods beyond the normal JES2 job selection criterion of JOBCLASS, SYSAFF, PRIORITY, and SCHENV to include the following list.

- Only select this job for execution on the system where it was submitted.
- Only select this job if a named WLM Scheduling Environment is available.
- Only select this job if another named job is currently running.
- Only select this job if another named job is NOT currently running.
- Only select this job after a named job ends, if that job is currently running.
- Always select this job before another named job in the input queue.
- Allow or deny job selection based on other active jobs requirement for an arbitrary named resource.
- Hold the job on the input queue for a specified length of time before allowing it to be selected.
- Hold the job on the input queue until a specific time of day occurs, before allowing it to be selected.
- Only select the job if a specific scheduling environment is active. This is maintained for compatibility only since the SCHENV job parm does the same thing.

Other than the specific types of job selection restrictions listed above you also have the ability to specify, via JES2 parms, or JES2 modify commands, the following more general types of job selection restrictions;

- Limit the number of active jobs on a single member based on jobclass.
- Limit the number of active jobs on a single member based on a “masked” USERID associated with the job.
- Limit the number of active jobs on a single member based on a “masked” JOBNAME value.
- You can set three different options to describe different ways you may want the BEFORE and AFTER jobname selection criterion to work. One of the options, “DELAY” will cause all jobs to be held on the input queue for a variable number

of seconds that you specify. There is a specific reason for causing this delay related to 'BEFORE' and 'AFTER' processing, but it may also be valuable to delay all jobs for a small number of seconds for other reasons.

You may also specify via JES2 parms or change via JES2 \$T commands, the following SSM processing options;

- If you want SMF recording for the SSM to take place. (* Not yet implemented *)
- The level of SMF recording that you want for SSM. (* Not yet implemented *)
- The SMF number that you want to use for SMF records.

The general format of the \$T SSM commands

All JES2 commands to modify SSM settings take the general form of

\$T SSM,option,option,option

All JES2 commands to display SSM setting take the general form of

\$D SSM,option,option,option

You may also display all of the SSM options with a single command -

\$D SSM

Multiple SSM displays or modifications can be issued at one time.

Examples of which are:

\$D SSM,CLASSLIM(A-G,B)=255,SMFOPT=NONE,BATIME=05

\$T SSM,CLASSLIM(A-Z)=0,SMFOPT=ALL,BATIME=01

Of course individual displays or modifications can be issue, as below.

\$T SSM,SMFOPT=NONE

\$D SSM,CLASSLIM(G)

Or all options can be displayed at one time by using the following command.

\$D SSM

The meaning and use of the individual options are detailed starting on the next page.

SSM Statement Options -

SMFNUM=0

SMFNUM specifies the number of the smf record that the shared spool mods will write its SMF data to, if SMFOPT is not set to NONE. Use a number between 200 and 255 that is not being used by any other products in your installation. At SunTrust we have smf number 216 reserved for this purpose. The default of zero specifies that no smf records will be written.

Note – SMF recording is still in the process of being added to these mods. Some SMF records will be written, but not everything documented in the SMF records is currently available.

Ex. \$D SSM,SMFNUM
\$T SSM,SMFNUM=227

SMFOPT=

SMFOPT= specifies the level of SMF recording, specify either ALL for all SMF record types, INPUT for a record of all shared spool mods input statements, ACTION for actions taken by the shared spool mods, and NONE if you do not want any SMF records written. .

Note – SMF recording is still in the process of being added to these mods. Some SMF records will be written, but not everything documented in the SMF records is currently available.

Ex. \$D SSM,SMFOPT
\$T SSM,SMFOPT=NONE

BEAFTER={ PREMOD | DELAY }

BEAFTER specifies how the BEFORE and AFTER statements are to be processed, PREMOD specifies that they should be handled as they have historically been handled. DELAY specifies that all jobs should wait on the input queue for a length of time specified in the BATIME operand. Delay can be used to correct some unintended job sequencing that can occur when multiple jobs are submitted simultaneously and they appear to get to the input queue “out of order”.

Ex. \$D SSM,BEAFTER
\$T SSM,BEAFTER=PREMOD

BATIME=###

BATIME is used to determine how many seconds a job must wait on the input queue before becoming eligible for execution if the BEAFTER= option is set to DELAY.

Ex. \$D SSM,BATIME=003

\$T SSM,BATIME=004

UIDMASK=8 characters each is either an '*' or a 'U'

This specifies the Userid Mask. It is used in conjunction with the UIDMAX value. The USERID owning each active job (or about to be selected for execution job) is examined one character at a time and compares it to the UIDMASK, if the corresponding position in the UIDMASK is a 'U' the character from the UserID is extracted, if the character is an '*' the position is ignored. Once the end of the UserID field is reached, all the selected characters are concatenated to form an intermediate UIDMASK value. The UIDMAX value is used as a maximum count for all jobs that have a matching UIDMASK VALUE.

Ex. UIDMASK=UU*UU***
UIDMAX=2

Given the following USERIDS associated with the following jobs that are active:

- JOBNAME1 has a USERID of ABCD1234 - masked value = ABD1
- JOBNAME2 has a USERID of ABBD1999 - masked value = ABD1
- JOBNAME3 has a USERID of CBAD2000 - masked value = CBD2
- JOBNAME4 has a USERID of CBXD2050 - masked value = CBD2
- JOBNAME5 has a USERID of CBXD3050 - masked value = CBD3

A new job with a userid value of ABDD1000 - masked value = ABD1, would not be allowed to start since it would become the 3rd (1 more than the limit) job with the same masked value.

A new job with a userid value of CBBD3978 - masked value = CBD3, would be allowed to start since it would only bring the total for that masked value to 2 active jobs (JOBNAME5 + the new job with a userid of CBBD3978).

A new job with a userid value of CBXD4050 - masked value = CBD4, would be allowed to start since it would only bring the total for that masked value to 1 active job with that masked value.

Note - changing the UIDMASK and UIDMAX value to lower values will not affect jobs that have already been selected for execution. They can only affect the decision to allow or reject future jobs as they move from the input to execution queues.

Ex. \$D SSM,UIDMASK
\$T SSM,UIDMASK=UUUUU**U

JBNMAX=####

This is the maximum number of jobs to allow to concurrently execute with the same jobname masked value on this JES2 member. The default value is zero and indicates that this test should not be done when JES2 selects a potential job for execution.

Ex. \$D SSM,JBNMAX
 \$T SSM,JBNMAX=255

Note – at the time this feature was first implemented, you could not accomplish the same thing via standard JES2 commands. Now JES2 commands are available that will accomplish the same task and we encourage you to use the JES2 version of control rather than the one documented here.

JBNMASK=a mask of 8 characters each either an ‘*’ or a ‘U’

This specifies the Jobname Mask. It is used in conjunction with the JBNMAX value. The JOBNAME of each active job (or about to be selected for execution job) is examined one character at a time and compared to the JBNMASK. If the corresponding position in the JBNMASK is a ‘U’ the character from the JOBNAME is extracted; if the character is an ‘*’ the position is ignored. Once the end of the JOBNAME field is reached, all the selected characters are concatenated to form an intermediate JBNMASK value. The JBNMAX value is used as a maximum count for all jobs that have a matching JBNMASK VALUE.

Example - JBNMASK=UU***U**

Given the following active jobnames, and a JBNMASK=U***U** value, and a JBNMAX=2 setting;

JOBNAME1	masked value = JOE
JOB0029	masked value = JO2
JOBX	masked value = JO
TSNAME1	masked value = TSE
TSBNAME	masked value = TSM
TSXXXM2	masked value = TSM
JOB002X77	masked value = JO2

A newly selected job with a jobname of JOB992 would have a JBNMASK value of JO2, and would not be allowed to execute yet because it would exceed the limit of 2- (JOB002X77 and JOB0029) are already executing.

ALLOWS={ ON | OFF }

ALLOWS is an internal control developed specifically for use by the Capacity and Performance group. It should only be changed as directed by the Capacity and Performance group.

EX. \$T SSM,ALLOWS=OFF
\$D SSM,ALLOWS

CLASSOPT={ ON | OFF }

CLASSOPT determines whether or not the classlim values that limit the number of active jobs on this system, in each class are enforced or not. ON means that the classlim value for each class is being enforced. OFF means that the classlim value for each class is NOT being enforced. Note - setting a low limit will not stop, or cancel any jobs, it will just prevent any new jobs from starting until the total number of jobs for each class is within the limit specified in the CLASSLIM statement for each class.

EX. \$D SSM,CLASSOPT
\$T SSM,CLASSOPT=ON

CLASSLIM(class specification)=###

CLASSLIM specifies the maximum number of jobs for each class that will be allowed to start on the local copy of JES2. Valid CLASSLIM class specifications are;

A single character.

A range of characters ie. A-L or A-Z or 0-9

A masked value ie. * (meaning all classes)

A combination of the above separated by commas, ie. CLASSLIM(A-G,J,K,0-9)

EX \$D SSM,CLASSLIM
\$D SSM,CLASSLIM(A,J,N-R,5)
\$T SSM,CLASSLIM(A-9)=0

Note – at the time this feature was first implemented, you could not accomplish the same thing via standard JES2 commands. Now JES2 commands are available that will accomplish the same task and we encourage you to use the JES2 version of control rather than the one documented here.

The JES2 \$DJ command

The JES2 \$DJ command output has been extended to include information about any Shared Spool Mods statements for the job being displayed. Up to five CNTL names are displayed qualified with an “E” for exclusive, or an “S” for shared. One /*WITH jobname, one /*WITHOUT, one /*BEFORE and one /*AFTER jobname, will each be displayed if those types of statements are present in the job. /*HOLDFOR and /*HOLDTIL values and whether the timers have expired or elapsed are indicated if those cards are also present in the job being displayed. Examples of the extended displays are given below. Please note that the information is included in either the standard or long versions of the command.

Altered Display Commands –

-\$DJ(25926)

```
$HASP890 JOB(T0SM139)
$HASP890 JOB(T0SM139) STATUS=(AWAITING EXECUTION),CLASS=X,
$HASP890 PRIORITY=6,SYSAFF=(ANY),HOLD=(NONE),
$HASP890 DELAY RSN=HOLDTIL TIMR,AFTER=T0SM150,
$HASP890 BEFORE=T0SM160,WITH=T0SM140,WITHOUT=T0SM138,
$HASP890 HOLDFOR=00:02:00|ELAPSED,HOLDTIL=10:20:00,
$HASP890 CNTL=(RESNAME1-E,MYSTUFF-S,YOURSTUF-P,
$HASP890 COMMON-S,RESNAME1-E)
```

The **BOLD** text in the display (starting on the third output line) above is all as a result of Shared Spool Mods statements in the JCL. First the ‘DELAY RSN=’ is only displayed for jobs with Shared Spool Mods statements in the JCL, and indicates whether the job has been bypassed for job selection due to a Shared Spool Mods restriction or if it has simply never been selected by JES2 as a candidate for execution. In this case above the job is held due to the HOLDTIL timer value of 10:20:00. The AFTER=, BEFORE=, WITH=, and WITHOUT= all indicate the jobname associated with each like named control statement. The HOLDFOR= and HOLDTIL= fields indicate the time values specified, and whether or not they have elapsed. In this case the HOLDFOR time has expired, the HOLDTIL time has not. The CNTL= field lists the values specified in up to 5 /*CNTL statements followed by either a -S for shared, -E for exclusive, or -P for purge.

The LONG version of the Display Job command is shown below, it also contains the same Shared Spool Mods information that the short form of the display does.

-\$DJ(25926),LONG

```
$HASP890 JOB(T0SM139)
$HASP890 JOB(T0SM139) STATUS=(AWAITING EXECUTION),CLASS=X,
$HASP890 PRIORITY=6,SYSAFF=(ANY),HOLD=(NONE),
```

```

$HASP890          CMDAUTH=(LOCAL),OFFS=(),SECLABEL=,
$HASP890          USERID=T0SM0,SPOOL=(VOLUMES=(JES2T3),TGS=1,
$HASP890          PERCENT=0.0009),ARM_ELEMENT=NO,CARDS=16,
$HASP890          REBUILD=NO,SRVCLASS=BATTSTMD,SCHENV=TAPE,
$HASP890          SCHENV_AFF=(TSPC,TSPD),CC=(),DELAY=(),
$HASP890          CRTIME=(2007.116,13:42:07),
$HASP890          DELAY_RSN=HOLDTIL TIMR,AFTER=T0SM150,
$HASP890          BEFORE=T0SM160,WITH=T0SM140,WITHOUT=T0SM138,
$HASP890          HOLDFOR=00:02:00!ELAPSED,HOLDTIL=10:20:00,
$HASP890          CNTL=(RESNAME1-E,MYSTUFF-S,YOURSTUF-P,
$HASP890          COMMON-S,RESNAME1-E)

```

\$HASP943 messages

In addition informational messages, \$HASP943 are written to the log as jobs with /*CNTL, /*WITH, /*BEFORE, or /*AFTER are read. Examples of the messages follow.

These messages were issued for the job displayed above, as it was submitted. These form one of the audit trails available for used Shared Spool Mods options. The other audit trail option is of course the optional SMF recording.

```

$HASP943 T0SM139 * -- HOLD UNTIL = 10:20:00    --
$HASP943 T0SM139 * -- HOLD FOR = 00:02:00     --
$HASP943 T0SM139 * -- WITH   JOBNAME = T0SM140 --
$HASP943 T0SM139 * -- WITHOUT JOBNAME = T0SM138 --
$HASP943 T0SM139 * -- CONTROL INFO = RESNAME1,EXC --
$HASP943 T0SM139 * -- CONTROL INFO = MYSTUFF ,SHR --
$HASP943 T0SM139 * -- CONTROL INFO = YOURSTUF,PRG --
$HASP943 T0SM139 * -- CONTROL INFO = COMMON ,SHR --
$HASP943 T0SM139 * -- CONTROL INFO = RESNAME1,EXC --
$HASP943 T0SM139 * -- AFTER  JOBNAME = T0SM150 --
$HASP943 T0SM139 * -- BEFORE JOBNAME = T0SM160 --

```

The SSM OPTIONS can be displayed using the \$D SSM command, or altered using the \$T SSM command.

The initial values for SSM are set in JES2 parms, and take the format listed in the sample parms below.

```
SSM SMFOPT=ACTION,      /* SMF recording level */
  SMFNUM=216,           /* SMF number used to write smf records */
  BEAFTER=PREMOD,      /* BEFORE/AFTER processing options */
  BATIME=3,             /* Delay time, if BEAFTER=DELAY is selected*/
  UIDMAX=256,          /* Max.# of jobs with matching UID vals*/
  JBNMAX=0,            /* Max.# of jobs with matching JBNMASK vals*/
  UIDMASK=UUUUU***,    /* Mask used with UIDMAX to limit jobs by UID*/
  JBNMASK=*****,     /* Mask used with JBNMAX to limit jobs by JBN*/
  ALLOWS=OFF,          /*                               */
  CLASSOPT=ON,         /*enforce or don't enforce limits by jobclass*/
  CLASSLIM(A-Z,0-9)=234 /*limit for each class - if classopt=on*/
```

NOTE ** the JES2 LOADMOD statements for STJTABS and STSSMTBS, and the EXIT statements for EXIT(19) and EXIT(24) should physically be placed **BEFORE the SSM parmlib statements.**

SMF RECORD LAYOUTS

The SMF records produced by the Shared Spool Mods are sub-typed records all with the same SMF record number as specified in the SSM,SMFNUM=### statement. A different subtype is specified for each type of record.

Note – not all information documented in this SMF record layout is currently available. To see which fields are currently available either review the code, or turn SMF recording on and review the SMF records that are created.

** NOTE ** All SMF record processing has not yet been coded. We do create many specific record sub-types, but some are not yet handled by the code. You will have to check your SMF archives to see which smf sub-types are being captured.

If there are any questions about the use of this product, please contact via e-mail at;
Stephen.McColley@MVSPROGRAMMER.com

Fixes are handled on an as time permits basis, meaning I will fix all that I can in the time I have available. To get TRUE 24 x 7 support coverage, please see my website at <http://MVSPROGRAMMER.COM/SSMODS.html> for more information about support contracts for the Shared Spool Mods, or a potential commercial replacement for the Shared Spool Mods.
